

Installing R Packages on the DPUK Portal

- We make use of Microsoft R Open which mirrors the most up to date online CRAN library (MRAN).
- Users however will need to use the ‘checkpoint’ command to revert to older package variants, or indeed newer package variants. See <https://mran.microsoft.com/documents/rro/reproducibility> for more details.
- Users, as with Python, can upload the relevant package files for R packages not available via MRAN, such as community builds or Github published packages, and install these using the RStudio install packages GUI, or by using `install.packages()` commands in the terminal, by pointing to the correct path where the uploaded package file(s) are saved.
